NetSDK_JAVA

Programming Manual

Foreword

Purpose

Welcome to use NetSDK (hereinafter referred to be "SDK") programming manual (hereinafter referred to be "the manual").

SDK, also known as network device SDK, is a development kit for developer to develop the interfaces for network communication among surveillance products such as Network Video Recorder (NVR), Network Video Server (NVS), IP Camera (IPC), Speed Dome (SD), and intelligence devices.

The manual describes the SDK interfaces and processes of the general function modules for IPC, SD and Thermal IP Camera (TPC). For more function modules and data structures, refer to *NetSDK Development Manual*.

The example codes provided in the manual are only for demonstrating the procedure and not assured to copy for use.

Reader

- SDK software development engineers
- Project managers
- Product managers

Signals

The following categorized signal words with defined meaning might appear in the manual.

| Signal Words | Meaning | |
|------------------|---|--|
| A CAUTION | Indicates a potential risk which, if not avoided, could result in property damage, data loss, lower performance, or unpredictable result. | |
| OTIPS | Provides methods to help you solve a problem or save you time. | |
| NOTE | Provides additional information as the emphasis and supplement to the text. | |

Revision History

| Version | Revision Content | Release Time | |
|-----------------------------------|------------------------------------|---------------------------------------|--|
| | Added sections about transcoding. | | |
| V1.0.4 | Added extension commands for | July 2024 | |
| | parameter 4 of PTZ control. | | |
| V1.0.3 | Added system permissions under the | July 2023 | |
| dynamic library path. | | July 2023 | |
| V1.0.2 Updated some descriptions. | | February 2023 | |
| | | · · · · · · · · · · · · · · · · · · · | |
| V1.0.1 | Deleted some library files. | April 2021 | |
| V1.0.0 | First release. | February 2020 | |
| | | , | |

About the Manual

- The manual is for reference only. If there is inconsistency between the manual and the actual product, the actual product shall govern.
- All the designs and software are subject to change without prior written notice. The product updates might cause some differences between the actual product and the manual. Please contact the customer service for the latest program and supplementary documentation.
- There still might be deviation between the actual value of some data and the value provided, if there is any doubt or dispute, please refer to our final explanation.
- Please contact the supplier or customer service if there is any problem occurred when using the device
- We are not liable for any loss caused by the operations that do not comply with the manual.
- All trademarks, registered trademarks and the company names in the manual are the properties
 of their respective owners.
- Please visit our website or contact your local service engineer for more information. If there is any uncertainty or controversy, please refer to our final explanation.

Glossary

This chapter provides the definitions to some of the terms appear in the manual to help you understand the function of each module.

| Term | Definition |
|----------------------|--|
| Main Stream | A type of video stream that usually has better resolution and clarity and |
| Main Stream | provides a better experience if the network resource is not restricted. |
| | A type of video stream that usually has lower resolution and clarity than |
| Sub Stream | the main stream but demands less network resources. The user can |
| | choose the stream type according to the particular scenes. |
| | The video is numbered from 0 and each video receives a channel number. |
| Video Channel | Currently, except the TPC, the other types of devices usually have only one |
| | channel that is numbered as 0. |
| | The first step to access to the device is login (authentication). The device |
| Login Hondlo | receives a unique ID that refers to the login handle upon the successful |
| Login Handle | login. This handle will be used by the subsequent procedures and stay |
| | valid until logout. |
| | A fast positioning method in PTZ control by providing the difference value |
| Polativo Positionina | of the PTZ coordinates (X-axis and Y-axis) to the device which accord to |
| Relative Positioning | the present PTZ location and the difference value to calculate and transfer |
| | to the final location. This method also supports ZOOM control. |
| | A fast positioning method in PTZ control which provides certain |
| Absolute Desitioning | horizontal and vertical coordinates (angular coordinate) to the device. The |
| Absolute Positioning | device directly transfers to the user specified location. This method also |
| | supports ZOOM control. |
| | Pulse Code Modulation is one of the coding methods of digital |
| PCM | communication and converts the analog signal into digital signal without |
| | encoding loss. It is suitable for the user who requires higher data transfer |
| | rate and bandwidth. |
| PTZ | Pan Tilt Zoom is all-round movement and lens zoom control. |

1 Overview

1.1 General

The manual introduces SDK interfaces reference information that includes main function modules, interface functions, and callback functions.

The following are the main functions:

SDK initialization, device login, real-time monitoring, PTZ control, voice talk, alarm listening, smart subscription, record playback, record download and so on.

The development kit might be different dependent on the environment.

Table 1-1 Files of window development kit

| Library type | Library file name | Library file description |
|-----------------------|---------------------|--------------------------|
| | dhnetsdk.h | Header file |
| Function library | dhnetsdk.dll | Library file |
| | avnetsdk.dll | Library file |
| Configuration library | dhconfigsdk.h | Header file |
| | dhconfigsdk.dll | Library file |
| Auxiliary library of | dhplay.dll | |
| playing (coding and | | Playing library |
| decoding) | | |
| Auxiliary library of | StreamConvertor.dll | Transcoding library |
| "dhnetsdk.dll" | StreamConvertor.dii | Transcounty library |

Table 1-2 Files of Linux development kit

| Library type | Library file name | Library file description |
|-----------------------|-------------------|--------------------------|
| | dhnetsdk.h | Header file |
| Function library | libdhnetsdk.so | Library file |
| | libavnetsdk.so | Library file |
| Configuration library | dhconfigsdk.h | Header file |
| | libdhconfigsdk.so | Library file |

- The function library and configuration library are necessary libraries.
- The function library is the main body of SDK, which is used for interaction between client and products, remotely controls device, queries device data, configures device data information, and gets and handles the streams.
- The configuration library packs and parses the structures of configuration functions.
- It is recommended to use auxiliary library of playing (coding and decoding) to parse and play the streams.
- The auxiliary library decodes the audio and video streams and collects the local audio for the functions such as monitoring, playback and voice talk.

1.2 Applicability

- Recommended memory: No less than 512 M
- Jdk version: jdk1.6; jdk1.8
- System supported by SDK:
 - ♦ Windows

Windows 10, Windows 8.1, Windows 7 and Windows Server 2008/2003

Linux

The common Linux systems such as Red Hat and SUSE

1.3 Solutions of Library Loading Error

There are three kinds of dynamic libraries, Windows(.dll), and Linux(.so). Windows and Linux have 64-bit version and 32-bit version. And there are two main methods to call the call C ++ dynamic library, which are using the Java project directly and running the Java project as a jar package for other projects. During the loading of the library, the error of "Unable to find the dynamic library" will appear.

The root cause of "Unable to find the dynamic library" is the mismatch between the code path and the physical path. Compared with the Windows version, the dynamic library name of the Linux has a lib prefix. Therefore, when loading a dynamic library in the Linux environment, you need to pay attention to the lib prefix and add the lib prefix when stitching the dynamic library path. When using java.io.tmpdir to implement path mapping, note that this method has a lower priority.

1.3.1 Using Java Project in Windows

Possible error information:

```
[Load dhnetsdk path:./wrongpath/libs/win64/dhnetsdk]
```

Exception in thread "AWT-EventQueue-0" java.lang.UnsatisfiiedLinkError: Unable to load library './wrongpath/libs/win64/dhnetsdk': Unable to find specified module.

at com.sun.jna.NativeLibrary.loadLibrary(NativeLibrary.java:169)

at com.sun.jna.NativeLibrary.getInstance(NativeLibrary.java:242)

at com.sun.jna.Library\$Handler.<init>(Library.java:140)

When the above error information appears, you can locate the error according to the following code.

public interface NetSDKLib extends Library {

```
NetSDKLib NETSDK_INSTANCE = Native.load(LibraryLoad.getLoadLibrary("dhnetsdk"), NetSDKLib.class);
```

~~~~ LibraryLoad. getLibraryFold code is as follows:

// Get the dynamic library folder corresponding to the system

private static String getLibraryFold() {

String osType;

String osName = System.getProperty("os.name");

if (osName.toLowerCase().startsWith("linux")) {

```
osType = ARCH LINUX;
} else if (osName.toLowerCase().startsWith("mac")
     || osName.toLowerCase().startsWith("darwin")) {
  osType = ARCH_MAC;
} else if (osName.toLowerCase().startsWith("windows")) {
  osType = ARCH_WINDOWS;
} else {
  osType = "";
}
String arch = System.getProperty("os.arch");
arch = arch.toLowerCase().trim();
if ("i386".equals(arch) | | "i686".equals(arch) | | "x86".equals(arch)) {
  arch = PREFIX_32 + "";
} else if ("x86_64".equals(arch) || "amd64".equals(arch)) {
  arch = PREFIX_64 + "";
} else if (arch.startsWith("arm")) {
  arch = PREFIX_ARM + "";
}else {
  arch = PREFIX_ARM + "";
}
System.out.println("Dynamic library folder:"+osType + arch);
return osType + arch;
```

#### Solution

The error is usually caused by a mismatch between the jdk version and the system environment: If the jdk of the java project is 32-bit, the system environment is 64-bit, but the sdk is 64-bit, the error above will occur. The version of the sdk project, jdk, and operating system must be the same. They need to be win64 or win32.

#### Note

Winodws platform is less likely to have errors, and here is just an example. Note that the platform must correspond to the dynamic library, and the dynamic library suffix for Windows is .dll.

# 1.3.2 Using Java Project in Linux

Running the Example Code by Script Code in Linux (the script code path is run.sh in the root directory)

```
[user@localhost ~]# ./run.sh com/netsdk/demo/customize/ConfigDemo
ClassPath: ../resources/jna.jar:../resources/gson-2.6.2.jar:../resources/fastjson-1.2.70.jar:../resources/IN
etSDK.jar:../resources/dynamic-lib-load.xml:
--> Bin ../bin
Create ../bin.
--> linux 64 System.
cp: Cannot obtain the file status (stat) of '../resources/linux64': The file or directory does not exist.
--> path: pwd
load library: /tmp/libdhnetsdk.so
Exception
             in
                  thread
                            "main"
                                     java.lang.UnsatisfiedLinkError:
                                                                        Unable
                                                                                               library
                                                                                       load
'/tmp/libdhnetsdk.so':

### Part of Run.sh Script Code

```
##Specify the path of the library Add dynamic link library

if [[ $os =~ "Darwin" ]]; then

#CP+=:../libs/mac64

echo "--> mac 64 System"

cp -r ../resources/mac64 $BIN/mac64

elif [ $(getconf LONG_BIT) = '64' ]; then

echo "--> linux 64 System."

#export LD_LIBRARY_PATH=../resources/linux64

cp -r ../resources/linux64 $BIN/linux64

else

echo "--> linux 32 System."

#export LD_LIBRARY_PATH=../libs/linux32

cp -r ../resources/linux32 $BIN/linux32
```

#### Note

Similar to windows. However, if the error is not found, check whether the PATH introduced in the script is consistent with the system path when the dynamic library is correct.

#### Solution

Select one of the methods to solve the issue.

- Method 1: Similar to Windows system, check whether the environment configuration is consistent.
- Method 2: Temporary folder loading method—java.io.tmpdir. This method is suitable for multiple platforms. You need to change the path parameter in public static void setExtractPath(String path) method to the absolute path.
  - ♦ Copy the required dynamic library to a folder, such as D:/win64.
  - ♦ Use the static statement block to call: (path should be consistent).

```
static{
    LibraryLoad.setExtractPath(String path) };
}
```

# 1.3.3 Using Project as a jar Package

The advantage of having the dynamic library built into the jar package is that as long as the jar package is exported, the jar can be executed directly regardless of the differences between the platforms.

Here is a way to make the build-in jar package. You need to write the dynamic library of jar package into the local temporary folder (java.io.tmpdir), read the dynamic library from the local machine, and then load it to memory. The following is the example code.

```
public interface NetSDKLib extends Library {
NetSDKLib NETSDK_INSTANCE = Native.load(LibraryLoad.getLoadLibrary("dhnetsdk"),
NetSDKLib.class);
NetSDKLib CONFIG_INSTANCE = Native.load(LibraryLoad.getLoadLibrary("dhconfigsdk"),
NetSDKLib.class);
    public class LibraryLoad {
            public static String getLoadLibrary(String libraryName) {
    currentFold = getLibraryFold();
    if (dynamicParseUtil == null) {
       try {
         dynamicParseUtil =
              new DynamicParseUtil(
        LibraryLoad.class.getClassLoader().getResourceAsStream("dynamic-lib-load.xml"));
         if (!written) {
           for (String libName: dynamicParseUtil.getLibsSystem(currentFold)) {
              extractLibrary(libName);
           }
            written = true;
         }
       } catch (ParserConfigurationException | IOException | SAXException e) {
         e.printStackTrace();
       }
    }
    String fullName = getLibraryName(libraryName);
    String path = EXTRACT_PATH;
    if (!(EXTRACT_PATH.endsWith("/") || EXTRACT_PATH.endsWith("\\"))) {
       path = EXTRACT_PATH + "/";
    System.out.println("load library: " + path + fullName);
    return path + fullName;
```

```
}
}
```

# 1.3.4 System Permissions under Dynamic Library Path

For Windows and Linux, the Java project copies the dynamic library to a temporary directory in the system. The temporary directory path can be obtained by using the following code function in the LibraryLoad class.

Make sure that you have the read and write permissions for the dynamic library files in this path. If not, you might fail to load the dynamic library.

```
String fullName = getLibraryName(libraryName);

String path = EXTRACT_PATH;

if (!(EXTRACT_PATH.endsWith("/") || EXTRACT_PATH.endsWith("\\"))) {

   path = EXTRACT_PATH + "/";
}

System.out.println("load library: " + path + fullName);
```

# 1.4 Upgrade Early jna to Latest Version

- Step 1 Replace the jna package of the old version in the resources/ directory with the jna package of the new version. Configure the new version of jna into the current environment.
- <u>Step 2</u> Change the library loading method of NetSDKLib encapsulation class to the following.

 $NetSDKLib\ NETSDK\_INSTANCE = Native.load(LibraryLoad.getLoadLibrary("dhnetsdk"), \\ NetSDKLib.class);$ 

<u>Step 3</u> In the NativeString class, change the parameters in the Pointer.getString method and Pointer.setString method to pointer.getString (0) and pointer.setString (0, string).

After upgrading the jna, if there is a callback function in the running demo and StdCallCallback is inherited, you need to comment out StdCallCallback; otherwise it will crash when running under the Linux environment.

# **2 Function Modules**

There are 10 function modules in this chapter. Each function module includes SDK initialization, device login, logout, and SDK resource release. The optional processes do not affect the use of other processes.

# 2.1 SDK Initialization

## 2.1.1 Introduction

Initialization is the first step of SDK to conduct all the function modules. It does not have the surveillance function but can set some parameters that affect the SDK overall functions.

- Initialization occupies some memory.
- Only the first initialization is valid within one process.
- After using this function, call cleanup interface to release SDK resource.

### 2.1.2 Interface Overview

Table 2-1 Interfaces of initialization

| Interface               | Implication                                 |
|-------------------------|---------------------------------------------|
| CLIENT_Init             | SDK initialization                          |
| CLIENT_Cleanup          | SDK cleaning up                             |
| CLIENT_SetAutoReconnect | Setting of reconnection after disconnection |
| CLIENT_SetNetworkParam  | Setting of network environment              |

#### 2.1.3 Process

Initialize SDK
CLIENT\_Init

Set reconnection callback
CLIENT\_SetAutoReconnet

Set network parameter
CLIENT\_SetNetWorkParam

Release SDK resources
CLIENT\_Cleanup

Mandatory
End
Optional

Figure 2-1 Process of initialization

#### **Process Description**

- Step 1 Call **CLIENT\_Init** to initialize SDK.
- <u>Step 2</u> (Optional) Call **CLIENT\_SetAutoReconnect** to set reconnection callback to allow the auto reconnecting after disconnection.
- <u>Step 3</u> (Optional) Call **CLIENT\_SetNetworkParam** to set network login parameter that includes connection timeout and connection attempts.
- Step 4 After using all SDK functions, call **CLIENT Cleanup** to release SDK resource.

#### **Notes for Process**

- Call **CLIENT\_Init** and **CLIENT\_Cleanup** in pairs. It supports single thread multiple calling but it is suggested to call the pair for only one time overall.
- Initialization: Calling **CLIENT\_Init** multiple times is only for internal count without repeating applying resources.
- Cleaning up: The interface CLIENT\_Cleanup clears all the opened processes, such as login, real-time monitoring, and alarm subscription.
- Reconnection: SDK can set the reconnection function for the situations such as network disconnection and power off. SDK will keep logging the device until succeeded. Only the real-time monitoring, alarm and snapshot subscription resume after reconnection is successful.
- Dynamic library loading: If there is an error "Unable to load library './wrongpath/libs/win64/dhnetsdk': The specified module cannot be found" when loading the dynamic library, usually the path does not match. You need to adjust the path of the dynamic library or modify the code based on the error codes. This problem is more common when packaging the whole project and providing the jar package to other projects. Because this

problem is related to the use of the platform and the project, it cannot be generalized and requires specific analysis.

For example, if you want to use the project directly on the Linux platform, you can load the dynamic library path into the dynamic library search path by the following ways:

- ♦ Enter "export LD\_LIBRARY\_PATH = \$ LD\_LIBRARY\_PATH: / XXX" in the terminal. The current terminal takes effect.
- Modify "~ / .bashrc" or "~ / .bash\_profile", and add "export LD\_LIBRARY\_PATH = \$ LD\_LIBRARY\_PATH: / XXX" in the last line. After saving, you can use "source.bashrc" to execute the file. The current user takes effect.
- ♦ Modify "/ etc / profile", and then add "export LD\_LIBRARY\_PATH = \$ LD\_LIBRARY\_PATH: / XXX". After saving, you can use "source" to execute the file. Effective for all users.

# 2.1.4 Example Code

```
import java.io.File;
import main.java.com.netsdk.lib.NetSDKLib;
import main.java.com.netsdk.lib.NetSDKLib.LLong;
import main.java.com.netsdk.lib.ToolKits;
import com.sun.jna.ptr.IntByReference;
 * Implement login interface
 * Mainly are initialization, login and logout functions.
 */
public class LoginModule {
    public static NetSDKLib netsdk
                                          = NetSDKLib.NETSDK_INSTANCE;
    public static NetSDKLib configsdk
                                         = NetSDKLib.CONFIG INSTANCE;
    // Login handle
    public static LLong m_hLoginHandle = new LLong(0);

                                   = false;
    private static boolean bLogopen = false;
    //Initialize
    public static boolean init(NetSDKLib.fDisConnect disConnect, NetSDKLib.fHaveReConnect
haveReConnect) {
         blnit = netsdk.CLIENT_Init(disConnect, null);
         if(!blnit) {
```

```
System.out.println("Initialize SDK failed");
              return false;
         }
         // (Optional) Open logs
         NetSDKLib.LOG_SET_PRINT_INFO setLog = new NetSDKLib.LOG_SET_PRINT_INFO();
         File path = new File("./sdklog/");
         if (!path.exists()) {
              path.mkdir();
         }
         String logPath = path.getAbsoluteFile().getParent() + "\sdklog\" + ToolKits.getDate() + ".log";
         setLog.nPrintStrategy = 0;
         setLog.bSetFilePath = 1;
         System.arraycopy(logPath.getBytes(), 0, setLog.szLogFilePath, 0, logPath.getBytes().length);
         System.out.println(logPath);
         setLog.bSetPrintStrategy = 1;
         bLogopen = netsdk.CLIENT_LogOpen(setLog);
         if(!bLogopen) {
              System.err.println("Failed to open NetSDK log");
         }
         // Set the callback of reconnection after disconnection. After setting, the SDK will automatically
reconnect when device disconnects.
         // This operation is optional but recommended.
         netsdk.CLIENT_SetAutoReconnect(haveReConnect, null);
         // (Optional) Set login timeout and login times
         int waitTime = 5000; //Set the timeout of request response as 5 senconds
         int tryTimes = 1; // Try to establish a link once during login
         netsdk.CLIENT_SetConnectTime(waitTime, tryTimes);
         // Set other network parameters, such as nWaittime of NET_PARAM, member of nConnectTryNum
and CLIENT_SetConnectTime.
         // (Optional) Set the login timeout of device and login times having same meaning.
         NetSDKLib.NET_PARAM netParam = new NetSDKLib.NET_PARAM();
         netParam.nConnectTime = 10000;
                                                 // Timeout of trying to establish a link during login
         netParam.nGetConnInfoTime = 3000; // Timeout of setting subconnection
         netsdk.CLIENT_SetNetworkParam(netParam);
         return true;
```

```
// Clean up environment

public static void cleanup() {
    if(bLogopen) {
        netsdk.CLIENT_LogClose();
    }

    if(bInit) {
        netsdk.CLIENT_Cleanup();
    }
}
```

# 2.2 Device Login

### 2.2.1 Introduction

Device login, also called user authentication, is the precondition of all the other function modules. You will obtain a unique login ID upon log in to the device and should introduce login ID before using other SDK interfaces. The login ID becomes invalid once logged out.

# 2.2.2 Interface Overview

Table 2-2 Interfaces of device login

| Interface                         | Implication          |
|-----------------------------------|----------------------|
| CLIENT_LoginWithHighLevelSecurity | High-security login. |
| CLIENT_Logout                     | Logout.              |

#### 2.2.3 Process

Initialize SDK
CLIENT\_Init

Log in to the device
CLIENT\_LoginWithHighLevelS
ecurity

Particular function module

Log out
CLIENT\_Logout

Release SDK resources CLIENT\_Cleanup

End

Figure 2-2 Process of login

### **Process Description**

- Step 1 Call **CLIENT\_Init** to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> After successful login, you can realize the required function module.
- <u>Step 4</u> After using the function module, call **CLIENT\_Logout** to log out of the device.
- <u>Step 5</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resource.

#### **Notes for Process**

- Login handle: When the login is successful, the returned value is not 0 (even the handle is smaller than 0, the login is also successful). One device can log in for multiple times with different handle at each login. If there is not special function module, it is suggested to login only one time. The login handle can be repeatedly used on other function modules.
- Duplicate handles: It is normal that the login handle is the same as the existed handle. For example, log in to device A and get handle loginIDA. However, if you log out of loginIDA and then log in, you may get LoginIDA again. But the duplicate handles do not occur throughout the lifetime of the handle.
- Logout: The interface will release the opened functions internally, but it is not suggested to rely
  on the cleaning up function. For example, if you opened the monitoring function, you should
  call the interface that stops the monitoring function when it is no longer required.

- Use login and logout in pairs: The login consumes some memory and socket information and release sources once logout.
- Login failure: It is suggested to check the failure through the error parameter of the login interface. For the common error code, see Table 2-3.
- Multi-device login: After the SDK is initialized, you can log in to multiple devices, but the corresponding login handle and login information need to be adjusted.

Table 2-3 Error code and meaning

| Error code | Meaning                                                                       |
|------------|-------------------------------------------------------------------------------|
| 1          | Password is wrong                                                             |
| 2          | User name does not exist                                                      |
|            | Login timeout                                                                 |
|            | Evasion example code is as follows:                                           |
| 3          | <pre>NET_PARAM stuNetParam = {0};</pre>                                       |
| 3          | stuNetParam.nWaittime = 8000; // unit ms                                      |
|            | stunetParam.nGetConnInfoTime = 3000; // Set connection timeout                |
|            | CLIENT_SetNetworkParam (&stuNetParam);                                        |
| 4          | The account has been logged in                                                |
| 5          | The account has been locked                                                   |
| 6          | The account is blocklisted                                                    |
| 7          | Out of resources, the system is busy                                          |
| 8          | Sub connection failed                                                         |
| 9          | Main connection failed                                                        |
| 10         | Exceeded the maximum user connections                                         |
| 11         | Lack of avnetsdk or avnetsdk dependent library                                |
| 12         | USB flash disk is not inserted into device, or the USB flash disk information |
|            | error                                                                         |
| 13         | The client IP is not authorized with login                                    |

# 2.2.4 Example Code

```
//Initialize SDK and skip SDK cleanup
              // Device information
               public static NetSDKLib.NET_DEVICEINFO_Ex m_stDeviceInfo = new NetSDKLib.NET_DEVICEINFO_Ex();
              // Login handle
               public static LLong m_hLoginHandle = new LLong(0);
              // Log in to device
               public static boolean login(String m_strlp, int m_nPort, String m_strUser, String m_strPassword) {
                             IntByReference nError = new IntByReference(0);
                             m\_hLoginHandle = netsdk.CLIENT\_LoginEx2(m\_strlp, m\_nPort, m\_strUser, m\_strPassword, 0, null, m\_strUser, m\_strUser, m\_strPassword, 0, null, m\_strUser, m\_
m_stDeviceInfo, nError);
                             if(m_hLoginHandle.longValue() == 0) {
                                             System.err.printf("Login Device[%s] Port[%d]Failed. %s\n", m_strlp, m_nPort,
ToolKits.getErrorCodePrint());
                             } else {
                                             System.out.println("Login Success [ " + m_strlp + " ]");
                             }
                             return m_hLoginHandle.longValue() == 0? false:true;
             }
              // Log out of device
               public static boolean logout() {
                             if(m_hLoginHandle.longValue() == 0) {
                                             return false;
                             }
                             boolean bRet = netsdk.CLIENT_Logout(m_hLoginHandle);
                             if(bRet) {
                                             m_hLoginHandle.setValue(0);
                             }
                             return bRet;
              }
```

# 2.3 Real-time Monitoring

#### 2.3.1 Introduction

Real-time monitoring obtains the real-time stream from the storage device or front-end device, which is an important part of the surveillance system.

SDK can get the main stream and sub stream from the device once it logged.

- Supports calling the window handle for SDK to directly decode and play the stream (Windows system only).
- Supports calling the real-time stream to you to perform independent treatment.
- Supports saving the real-time record to the specific file though saving the callback stream or calling the SDK interface.

## 2.3.2 Interface Overview

Table 2-4 Interfaces of real-time monitoring

| Interface                    | Implication                                             |
|------------------------------|---------------------------------------------------------|
| CLIENT_RealPlayEx            | Start real-time monitoring extension interface.         |
| CLIENT_StopRealPlayEx        | Stop real-time monitoring extension interface.          |
| CLIENT CoveDeelDete          | Start saving the real-time monitoring data to the local |
| CLIENT_SaveRealData          | path.                                                   |
| CLIENT StanSavaDaalData      | Stop saving the real-time monitoring data to the local  |
| CLIENT_StopSaveRealData      | path.                                                   |
| CLIENT CotDoolDotaCollDockEy | Set real-time monitoring data callback function         |
| CLIENT_SetRealDataCallBackEx | extension interface.                                    |

#### 2.3.3 Process

You can realize the real-time monitoring through SDK decoding library or your play library.

# 2.3.3.1 SDK Decoding Play

Call PlaySDK library from the SDK auxiliary library to realize real-time play.

Figure 2-3 Process of playing by SDK decoding library

# **Process Description**

- Step 1 Call **CLIENT\_Init** to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> Call **CLIENT\_RealPlayEx** to enable the real-time monitoring. The parameter hWnd is a valid window handle.
- <u>Step 4</u> (Optional) Call **CLIENT\_SaveRealData** to start saving the monitoring data.
- <u>Step 5</u> (Optional) Call **CLIENT\_StopSaveRealData** to end the saving process and generate the local video file.
- <u>Step 6</u> After using the real-time function, call **CLIENT\_StopRealPlayEx** to stop real-time monitoring.
- <u>Step 7</u> After using the function module, call **CLIENT\_Logout** to log out of the device.
- <u>Step 8</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resource.

#### **Notes for Process**

- SDK decoding play only supports Windows system. You need to call the decoding after getting the stream in other systems.
- Multi-thread calling: Multi-thread calling is not supported for the functions within the same login session; however, multi-thread calling can deal with the functions of different login sessions although such calling is not recommended.
- Timeout: The request on applying for monitoring resources should have made some agreement
  with the device before requiring the monitoring data. There are some timeout settings (see
  "NET\_PARAM structure"), and the field about monitoring is nGetConnInfoTime. If there is
  timeout due to the reasons such as bad network connection, you can modify the value of
  nGetConnInfoTime bigger.

The example code is as follows. Call it for only one time after having called **CLIENT\_Init**.

NET\_PARAM stuNetParam = new NET\_PARAM();

stuNetParam. nGetConnInfoTime = 5000; 0, default is 1000 ms.

CLIENT\_SetNetworkParam (stuNetParam);

- Failed to repeat opening: For some models, the same channel cannot be opened for multiple times during the one entire logged in status. If you are trying to open it repeatedly, you will success in the first try but get failed afterwards. In this case, you can try the following:
  - Close the opened channel. For example, if you already opened the main stream video on the channel 1 and still want to open the sub stream video on the same channel, you can close the main stream first and then open the sub stream.
  - ♦ Login twice to obtain two login handles to deal with the main stream and sub stream respectively.
- Calling succeeded but no image: SDK decoding needs to use dhplay.dll. It is suggested to check if dhplay.dll and its auxiliary library are missing under the running directory. See Table 1-1.
- If the system resource is insufficient, the device might return error instead of stream. You can receive an event DH\_REALPLAY\_FAILD\_EVENT in the alarm callback that is set in CLIENT\_SetDVRMessCallBack. This event includes the detailed error codes. See "DEV\_PLAY\_RESULT Structure" in Network SDK Development Manual.chm.
- 32 channels limit: The decoding consumes resources especially for the high definition videos.
   Considering the limited resources at the client, currently the maximum channels are set to be 32.
   If more than 32, it is suggested to use third party play library. See "2.3.3.2 Call Third Party Play Library."

# 2.3.3.2 Call Third Party Play Library

SDK calls back the real-time monitoring stream to you and you call PlaySDK to decode and play.

Figure 2-4 Process of calling third party play library Begin Initialize SDK CLIENT\_Init Log in to the device CLIENT\_LoginWithHighLevelSecurity Start monitoring, hWnd calls NULL CLIENT\_RealPlayEx Set callback Call fRealDataCallBackEx to CLIENT\_SetRealDataCallBackEx parse the code stream Stop real-time monitoring Pass data into CLIENT\_StopRealPlayEx PLAY\_InputData to decode Log out CLIENT\_Logout Release SDK resources CLIENT\_Cleanup End

Process Description

- Step 1 Call **CLIENT\_Init** to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> After successful login, call **CLIENT\_RealPlayEx** to enable real-time monitoring. The parameter hWnd is NULL.
- <u>Step 4</u> Call **CLIENT\_SetRealDataCallBackEx** to set the real-time data callback.
- <u>Step 5</u> In the callback, pass the data to PlaySDK to finish decoding.
- <u>Step 6</u> After completing the real-time monitoring, call **CLIENT\_StopRealPlayEx** to stop real-time monitoring.
- <u>Step 7</u> After using the function module, call **CLIENT\_Logout** to log out of the device.
- <u>Step 8</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resource.

#### **Notes for Process**

- Stream format: It is recommended to use PlaySDK for decoding.
- Lag image
  - ♦ When using PlaySDK for decoding, there is a default channel buffer size (the PLAY\_OpenStream interface in playsdk) for decoding. If the stream resolution value is big, it is recommended to modify the parameter value smaller such as 3 M.
  - SDK callbacks can move to the next video data only after returning from you. It is not recommended for you to consume time for the unnecessary operations; otherwise the performance could be affected.

# 2.3.4 Example Code

# 2.3.4.1 SDK Decoding Play

```
import java.awt.Panel;
import main.java.com.netsdk.lib.NetSDKLib.LLong;
import main.java.com.netsdk.lib.ToolKits;
import com.sun.jna.Native;
/**
 * Implement live interface
 * Mainly are streaming starting function and streaming stopping function.
 */
public class RealPlayModule {
    // Start live view
    public static LLong startRealPlay(int channel, int stream, Panel realPlayWindow) {
         LLong m_hPlayHandle = LoginModule.netsdk.CLIENT_RealPlayEx(LoginModule.m_hLoginHandle,
channel, Native.getComponentPointer(realPlayWindow), stream);
         if(m_hPlayHandle.longValue() == 0) {
              System.err.println("failed to real-time monitoring, and the error code " +
ToolKits.getErrorCodePrint());
         } else {
              System.out.println("Success to start realplay");
// Customize stream to save file. Do this operation when you need to save the video.
String outFile="example/outputfile";
LoginModule.netsdk.CLIENT_SaveRealData(m_hPlayHandle,outFile);
```

```
    return m_hPlayHandle;

    // Stop live view
    public static void stopRealPlay(LLong m_hPlayHandle) {
        if(m_hPlayHandle.longValue() == 0) {
            return;
        }

// Close file saving
LoginModule.netsdk.CLIENT_StopSaveRealData(m_hPlayHandle);
        boolean bRet = LoginModule.netsdk.CLIENT_StopRealPlayEx(m_hPlayHandle);
        if(bRet) {
            m_hPlayHandle.setValue(0);
        }
    }
}
```

#### 2.3.4.2 Call Play Library

```
public class RealPlayModule {
                             class DataCallBackEx implements NetSDKLib.fRealDataCallBackEx{
                                                          @Override
                                                         public void invoke(LLong IRealHandle, int dwDataType, Pointer pBuffer,

```

# 2.4 Video Snapshot

#### 2.4.1 Introduction

Video snapshot can get the picture data of the playing video. This section introduces the following snapshot ways:

- Synchronous snapshot: Call the SDK interface which sends the snapshot command to the
  device. The device will capture the current image and send to SDK through network, and then
  SDK returns the image data to you
- Asynchronous snapshot: Call the SDK interface and set snapshot callback so that the captured image data shows in callback function. At the same time, call asynchronous snapshot interface to snapshot.
- Local snapshot: When the monitoring is opened, you can save the monitoring data in the
  picture format which is the frame information that does not have network interaction with the
  device.

#### 2.4.2 Interface Overview

Table 2-5 Interfaces of video snapshot

| Interface                | Implication                        |
|--------------------------|------------------------------------|
| CLIENT_SnapPictureToFile | Snap picture and send to the user. |

| Interface                 | Implication                                              |
|---------------------------|----------------------------------------------------------|
| CLIENT_CapturePictureEx   | Local snap and the parameter could be the handle of      |
|                           | monitoring or playback.                                  |
| CLIENT_SetSnapRevCallBack | Set snapshot callback to implement fSnapRev interface.   |
| CLIENT_SnapPictureEx      | Asynchronous snapshot which is suitable for              |
|                           | non-intelligent traffic devices and parking lot devices, |
|                           | such as IPC and speed dome.                              |

#### 2.4.3 Process

Video snapshot is consisted of synchronous snapshot, asynchronous snapshot and local snapshot.

## 2.4.3.1 Synchronous Snapshot

Figure 2-5 Process of synchronous snapshot

# **Process Description**

- Step 1 Call **CLIENT\_Init** to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> Call **CLIENT\_SnapPictureToFile** to get the picture data.
- <u>Step 4</u> Call **CLIENT\_Logout** to log out of the device.

#### **Notes for Process**

- Picture size limit: SDK allocates the fixed memory to receive the picture data returned from the device. If the picture is larger than the fixed memory, SDK will return the truncated data.
- SDK provides the interface to modify the default memory. If the picture (for example, the high definition picture) is truncated, you can modify the value of nPicBufSize bigger. The example code is as follows. After calling **CLIENT\_Init**, call the example code just one time.

```
NET_PARAM stuNetParam = new NET_PARAM();
stuNetParam. nPicBufSize = 4000*1024*1024; nPicBufSize is 2M by default
CLIENT_SetNetworkParam (stuNetParam);
```

- Multi-thread calling: Multi-thread calling is not supported for the functions within the same login session.
- Snapshot configuration: You can configure the network snapshot such as quality and definition.
   However, if you are satisfied with the default configurations, do not modify them.
- Picture save format: The picture data returns as memory and the interface supports saving it as file (the precondition is that you have set the szFilePath field of NET\_IN\_SNAP\_PIC\_TO\_FILE\_PARAM).

## 2.4.3.2 Asynchronous Snapshot

Initialize S DK
CLIENT\_Init

Log in to device
CLIENT\_LoginWith HighLevelSecurity

Set snapshot callback
CLIENT\_SetSnapRevCallBack

Trigger snapshot
CLIENT\_SnapPictureEx

Log out
CLIENT\_Logout

Release SDK resources
CLIENT\_Cleanup

End

Figure 2-6 Process of asynchronous snapshot

## **Process Description**

- Step 1 Call **CLIENT\_Init** to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> Call **CLIENT\_SetSnapRevCallBack** to set snapshot callback.
- <u>Step 4</u> Call **CLIENT\_SnapPictureEx** to trigger snapshot and then analyze captured image data in the callback function.
- <u>Step 5</u> Call **CLIENT\_Logout** to log out of the device.
- <u>Step 6</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resource.

#### 2.4.3.3 Local Snapshot

Begin Initialize SDK CLIENT\_Init Log in to device CLIENT\_LoginWithHighLevelSecurity Start monitoring. hWnd introduces valid handle CLIENT\_RealPlayEx2 Introduce monitoring handle for local snapshot CLIENT\_CapturePictureEx Stop real-time monitoring CLIENT\_StopRealPlayEx Log out CLIENT\_Logout Release SDK resources CLIENT\_Cleanup End

Figure 2-7 Process of local snapshot

## **Process Description**

- Step 1 Call **CLIENT\_Init** to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> Call **CLIENT\_RealPlayEx** to start monitoring and obtain the monitoring handle.
- <u>Step 4</u> Call **CLIENT\_CapturePictureEx** to introduce the monitoring handle.
- <u>Step 5</u> Call **CLIENT\_StopRealPlayEx** to stop the real-time monitoring.
- <u>Step 6</u> Call **CLIENT\_Logout** to log out of the device.
- <u>Step 7</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resource.

# 2.4.4 Example Code

```
/*

* Example of synchronous snapshot

*/

         pOutbuf.clear(snapParamOut.size());
         ToolKits.SetStructDataToPointer(snapParamOut, pOutbuf, 0);
if (!netsdkApi.CLIENT_SnapPictureToFile(loginHandle, pInbuf, pOutbuf, timeOut)) {
              System.err.printf("CLIENT_SnapPictureEx Failed! Last Error[%x]\n",
netsdkApi.CLIENT_GetLastError());
         }else {
              System.out.println("CLIENT_SnapPictureToFile Success." + new
File(fileName).getAbsolutePath());
         }
         Native.free(Pointer.nativeValue(plnbuf));//Clear up memory
         Pointer.nativeValue(plnbuf, 0); //Prevent repeated gc collection
         Native.free(Pointer.nativeValue(pOutbuf));
         Pointer.nativeValue(pOutbuf, 0);
*Example of local snapshot
*/
//Live view
int playType = NetSDKLib.NET_RealPlayType.NET_RType_Realplay; // Live view
m hRealPlayHandle = netsdkApi.CLIENT RealPlayEx(m hLoginHandle, channel,
Native.getComponentPointer(realplayPanel), playType);
if (m_hRealPlayHandle.longValue() == 0) {
              System.err.println("Failed to start real-time monitoring, and error code" +
ToolKits.getErrorCode());
```

```
return false;
         } else {
              System.out.println("Success to start realplay");
//Local snapshot
if (!LoginModule.netsdk.CLIENT_CapturePictureEx(hPlayHandle, picFileName,
NetSDKLib.NET CAPTURE FORMATS.NET CAPTURE JPEG))
 {
              System.err.printf("CLIENT_CapturePicture Failed!" + ToolKits.getErrorCodePrint());
} else {
              System.out.println("CLIENT_CapturePicture success");
    }
//Stop live view
if(m_hRealPlayHandle.longValue() != 0) {
              netsdkApi.CLIENT_StopRealPlayEx(m_hRealPlayHandle);
         }
* Example of asynchronous snapshot
*/
         /// Set snapshot callback: Pictures are mainly returned from SnapCallback.getInstance() invoke.
         netsdkApi.CLIENT\_SetSnapRevCallBack(SnapCallback.getInstance(), null);\\
         NetSDKLib.SNAP_PARAMS snapParam = new NetSDKLib.SNAP_PARAMS();
         snapParam.Channel = 0; // Snapshot channel
         snapParam.mode = 0; // Require for 1 frame
         snapParam.CmdSerial = serialNum ++; // Require for serial number, and the valid rage from 0
through 635535. The serial number out of the rage will be truncated.
         /// Trigger snapshot
         if (!netsdkApi.CLIENT_SnapPictureEx(loginHandle, snapParam, null)) {
System.err.printf("CLIENT_SnapPictureEx Failed! Last Error[%x]\n", netsdkApi.CLIENT_GetLastError());
              return;
         }
         // Ensure the generation of image data
         try {
              synchronized (SnapCallback.class) {
                   SnapCallback.class.wait(3000L); // Wait for 3 seconds by default, to prevent that the
callback is not triggered and then device freezes when the device is disconnected and then.
```

## 2.5 PTZ Control

#### 2.5.1 Introduction

PTZ is a mechanical platform that carries the device and the protective enclosure and performs remote control in all directions.

PTZ is consisted of two motors that can perform horizontal and vertical movement to provide the all-around vision.

This section provides guidance to you about how to control directions (there are eight directions: upper, lower, left, right, upper left, upper right, bottom left, and bottom right), focus, zoom, iris, fast positioning, and 3-dimensional positioning through SDK.

CLIENT\_DHPTZControlEx is a basic PTZ control interface. CLIENT\_DHPTZControlEx2 provides more functions for the extension interface. Both have similar usage, with the latter having additional parameters.

#### 2.5.2 Interface Overview

Table 2-6 Interface of PTZ control

| Interface              | Implication                                           |
|------------------------|-------------------------------------------------------|
| CLIENT_DHPTZControlEx  | PTZ control extension interface                       |
| CLIENT_DHPTZControlEx2 | PTZ control extension interface (extension interface) |

#### 2.5.3 Process

Direction control, focus, zoom and iris are the continuous operations. SDK provides start and stop interfaces to you for timing control.

Figure 2-8 Process of PTZ control

Both fast positioning and 3-dimensional positioning are considered as a single action, requiring only one call to the PTZ control interface.

Begin

Initialize SDK
CLIENT\_Init

Log in to the device
CLIENT\_LoginWithHighLevelSecurity

PTZ control operations
CLIENT\_DHPTZControlEx2

Log out of the device
CLIENT\_Logout

Release SDK resource CLIENT\_Cleanup

End

Figure 2-9 Process of PTZ control (one-time)

### **Process Description**

- <u>Step 1</u> Call **CLIENT\_Init** to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- Step 3 Call **CLIENT\_DHPTZControlEx2** to operate the PTZ according to the situation. Different PTZ commands might need different parameters, and part of commands need to call the corresponding stop command, such as moving left and moving right. For details, see "2.5.4 Example Code."
- Step 4 After using the function module, call CLIENT\_Logout to log out of the device.
- <u>Step 5</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resource.

#### **Notes for Process**

- Fast positioning: For the SD, take the current monitoring image center as origin, and the valid range of horizontal and vertical coordinates is [–8191, 8191]. For example, if the horizontal coordinate is 2000 and the vertical is 2000, the SD moves toward upper right and gets a new origin, which means the coordinate specified every time is only relative to the current location.
- 3-dimensional positioning: For the SD, there is an initial position first. The horizontal coordinate is [0, 3600] and the vertical is [-1800, 1800]. The coordinate specified each time is the absolute coordinate and is irrelevant to the location of the SD image last time.
- For more example code see the SDK package on the website (NetSDK\_Chn\_java\src\main\java\com\netsdk\demo\frame\PTZControl.java).

## 2.5.4 Example Code

```
* Implement interface of PTZ control.
 * Mainly are direction control, zoom, focus, and iris.
 */
public class PtzControlModule {
    /**
     * Upper-left
    public static boolean ptzControlUpStart(int nChannelID, int lParam1, int lParam2) {
         return LoginModule.netsdk.CLIENT_DHPTZControlEx(LoginModule.m_hLoginHandle, nChannelID,
                                         NetSDKLib.NET_PTZ_ControlType.NET_PTZ_UP_CONTROL,
                                         IParam1, IParam2, 0, 0);
    public static boolean ptzControlUpEnd(int nChannelID) {
         return LoginModule.netsdk.CLIENT_DHPTZControlEx(LoginModule.m_hLoginHandle, nChannellD,
                                          NetSDKLib.NET_PTZ_ControlType.NET_PTZ_UP_CONTROL,
                                          0, 0, 0, 1);
    }
// Call CLIENT_DHPTZControlEx2 to implement other functions which are the same as Up's. However, the input
type parameter of NetSDKLib.NET_PTZ_ControlType is different.
```

## 2.6 Voice Talk

#### 2.6.1 Introduction

Voice talk realizes the voice interaction between the local platform and the environment where front-end devices are located.

This section introduces how to use SDK to realize the voice talk with the front-end devices.

### 2.6.2 Interface Overview

Table 2-7 Interfaces of voice talk

| Interface           | Implication                   |
|---------------------|-------------------------------|
| CLIENT_StartTalkEx  | Start voice talk              |
| CLIENT_StopTalkEx   | Stop voice talk               |
| CLIENT_TalkSendData | Send voice data to the device |

| Interface         | Implication                                      |
|-------------------|--------------------------------------------------|
| CLIENT_AudioDecEx | Decode audio data (valid only in Windows system) |

#### 2.6.3 Process

When SDK has collected the audio data from the local audio card, or SDK has received the audio data from the front-end devices, SDK will call the callback of audio data.

You can call the SDK interface in the callback parameters to send the local audio data to the front-end devices, or call SDK interface to decode and play the audio data received from the front-end devices.

Figure 2-10 Process of voice talk

**Process Description** 

- <u>Step 1</u> Call **CLIENT\_Init** to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> Call **CLIENT\_SetDeviceMode** to set decoding information of voice talk. Set parameter emType as DH\_TALK\_ENCODE\_TYPE.
- Step 4 Call CLIENT\_StartTalkEx to set callback and start voice talk. In the callback, call CLIENT\_AudioDec to decode the audio data that is sent from the decoding device, and call CLIENT\_TalkSendData to send the audio data of the PC end to the device.
- <u>Step 5</u> Call **CLIENT\_StopTalkEx** to stop voice talk.
- <u>Step 6</u> After using the function module, call **CLIENT\_Logout** to log out of the device.
- <u>Step 7</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resource.

#### **Notes for Process**

- Voice encoding format: The example uses the common PCM format. SDK supports accessing the voice encoding format supported by the device. For more details of the example code, see the SDK package on the website (NetSDK\_Chn\_java\src\main\java\com\netsdk\demo\frame\Talk.java). If the default PCM can satisfy the requirement, it is not recommended to obtain the voice encoding format from the device.
- No sound at the device: The audio data needs to be collected by the device such as microphone.
   It is recommended to check if the microphone or other equivalent device is plugged in and if the CLIENT\_RecordStartEx succeeded in returning.

### 2.6.4 Example Code

```
* Implement voice talk
    * Implement start, stop and data callback of voice talk.
* \endif
    */
public class TalkModule {
              public static LLong m_hTalkHandle = new LLong(0); // Voice talk handle
              private static boolean m_bRecordStatus
                                                                                                                                                   = false;
                                                                                                                                                                                                                       // Is recording?
                  * Start voice talk
                  */
              public static boolean startTalk(int transferType, int chn) {
                            // Set the encoding format of voice talk

# 2.7 Alarm Listening

### 2.7.1 Introduction

Alarm listening is the function to analyze real-time stream by smart devices. When the set event occurs, alarm triggers.

### 2.7.2 Interface Overview

Table 2-8 Interfaces of alarm listening

| Interface                 | Implication                 |
|---------------------------|-----------------------------|
| CLIENT_StartListenEx      | Subscribe alarm from device |
| CLIENT_StopListen         | Stop subscribing alarm      |
| CLIENT_SetDVRMessCallBack | Set alarm listening         |

#### 2.7.3 Process

Figure 2-11 Process of alarm listening

### **Process Description**

- Step 1 Call **CLIENT Init** to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> Set alarm callback function and the way to call **CLIENT\_SetDVRMessCallBack**.
- <u>Step 4</u> Call **CLIENT\_StartListenEx** to start alarm listening.
- <u>Step 5</u> After alarm listening, the **fAnalyzerDataCallBack** callback gets the alarm events uploaded by devices and then notifies users.
- <u>Step 6</u> Call **CLIENT\_StopListen** to stop alarm listening.
- <u>Step 7</u> After using the function module, call **CLIENT\_Logout** to log out of the device.
- <u>Step 8</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resource.

#### **Notes for Process**

No uploaded data: Only when you call **CLIENT\_SetDVRMessCallBack**, will alarm data be acquired.

## 2.7.4 Example Code

```
// Set alarm callback
netSdk.CLIENT_SetDVRMessCallBack(callback, null);
// Start alarm listening
    if (listening) {
              return true;
         }
         listening = netSdk.CLIENT_StartListenEx(loginHandle);
         if (!listening) {
              System.err.println("Start Listen Failed!" + ToolKits.getErrorCode());
         } else {
              System.out.println("Start Listen Success.");
         }
//fmessCallback
public class MessCallBack implements NetSDKLib.fMessCallBack {
    private MessCallBack() {}
    private static class CallBackHolder {
         private static final MessCallBack cb = new MessCallBack();
    }
    public static final MessCallBack getInstance() {
         return CallBackHolder.cb;
    }
    @Override
    public boolean invoke(int lCommand, LLong lLoginID, Pointer pStuEvent,
              int dwBufLen, String strDevicelP, NativeLong nDevicePort,
              Pointer dwUser) {
         switch (ICommand) {
              case NetSDKLib.NET_ALARM_ACCESS_CTL_EVENT: // Access control event
              {
                   ALARM_ACCESS_CTL_EVENT_INFO msg = new ALARM_ACCESS_CTL_EVENT_INFO();
                   ToolKits.GetPointerData(pStuEvent, msg);
                   System.out.println(" 【Access control event 】 " + msg);
                   break:
              }
// Stop alarm listening
if (listening) {
              netSdk.CLIENT_StopListen(loginHandle);
```

```
listening = false;
}
```

# 2.8 Intelligent Event

### 2.8.1 Introduction

Intelligent event is the function to analyze real-time stream by smart devices. When the set event occurs, the alarm events will be sent to users, such as traffic violation and parking space.

SDK connects to the device and subscribes intelligent event function. When the device gets the intelligent events, they will be sent to SDK.

For the supported intelligent events, see the constants starting with EVENT\_IVS\_ in NetSDKLib.java, which include events such as regular traffic violation.

### 2.8.2 Interface Overview

Table 2-9 Interfaces of intelligent event

| Interface                | Implication                                      |
|--------------------------|--------------------------------------------------|
| CLIENT_RealLoadPictureEx | Subscribe alarm events.                          |
| CLIENT_StopLoadPic       | Stop subscribing intelligent events.             |
| fAnalyzerDataCallBack    | Get intelligent event information from callback. |

#### 2.8.3 Process

Figure 2-12 Process of intelligent event upload

### **Process Description**

- Step 1 Call **CLIENT\_Init** to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> Call **CLIENT\_ RealLoadPictureEx** to subscribe to smart traffic event to device.
- <u>Step 4</u> After subscribing, the **fAnalyzerDataCallBack** callback gets the alarm events uploaded by devices and then notifies users.
- <u>Step 5</u> After uploading, call **CLIENT\_StopLoadPic** to stop subscription.
- <u>Step 6</u> After using the function module, call **CLIENT\_Logout** to log out of the device.
- <u>Step 7</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resource.

#### **Notes for Process**

- Event type: Subscribe to all intelligent events (EVENT\_IVS\_ALL) if different intelligent events need to be uploaded. Also support to subscribe to a single intelligent event.
- Image receiving or not: The network environment of some devices is 3G or 4G. When the SDK is connected to the device, set bNeedPicFile parameter in the CLIENT\_RealLoadPictureEx to false if

images are not needed. Then only receive information about smart traffic event, without images.

### 2.8.4 Example Code

```
// Take access control event as an example.
// Skip steps of SDK initialization and login.
// Intelligence subscription handle
private LLong attachHandle = new NetSDKLib.LLong(0);
    /**
     * Subscribe to intelligence tasks
     */
    public void AttachEventRealLoadPic() {
         // Unsubscribe first. The device does not verify duplicate subscriptions, and duplication
events will be returned after repeated subscriptions.
         this.DetachEventRealLoadPic();
         // Need image.
         int bNeedPicture = 1;
         attachHandle
                                   netsdkApi.CLIENT_RealLoadPictureEx(loginHandle,
                                                                                          channel,
NetSDKLib.EVENT_IVS_ALL, bNeedPicture,
                  AnalyzerDataCB.getInstance(), null, null);
         if (attachHandle.longValue() != 0) {
              System.out.printf("Chn[%d] CLIENT_RealLoadPictureEx Success\n", channel);
         } else {
              System.out.printf("Ch[%d] CLIENT_RealLoadPictureEx Failed!LastError = %s\n",
channel, ToolKits.getErrorCode());
         }
    }
      * Cancel subscription
     */
    public void DetachEventRealLoadPic() {
         if (attachHandle.longValue() != 0) {

              }
```

# 2.9 Record Playback

### 2.9.1 Introduction

Record playback function plays the videos of a particular period in some channels to find the target videos for check.

The playback includes the following functions: Start playback, pause Playback, resume playback, and stop playback.

## 2.9.2 Interface Overview

Table 2-10 Interfaces of record playback

| Interface               | Implication                                                    |
|-------------------------|----------------------------------------------------------------|
| CLIENT_PlayBackByTimeEx | Playback by time.                                              |
| CLIENT_SetDeviceMode    | Set the work mode such as voice talk, playback, and authority. |
| CLIENT_StopPlayBack     | Stop record playback.                                          |
| CLIENT_PausePlayBack    | Pause or resume playback.                                      |

## 2.9.3 Process

After SDK initialization, you need to input channel number, start time, stop time, and valid window handle to realize the playback of the required record.

Figure 2-13 Process of record playback

### **Process Description**

- Step 1 Call CLIENT\_Init to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> (Optional) Call **CLIENT\_SetDeviceMode** twice and set the stream type parameter emType as DH\_RECORD\_STREAM\_TYPE and the record type parameter emType as DH\_RECORD\_TYPE.
- <u>Step 4</u> Call **CLIENT\_PlayBackByTimeEx** to start playback. The parameter hWnd is a valid window handle value.
- <u>Step 5</u> (Optional) Call **CLIENT\_PausePlayBack**. The playback will pause when the second parameter is 1.

- <u>Step 6</u> (Optional) Call **CLIENT\_PausePlayBack.** The playback will resume when the second parameter is 0.
- Step 7 Call CLIENT\_StopPlayBack to stop playback.
- <u>Step 8</u> After using the function module, call **CLIENT\_Logout** to log out of the device.
- <u>Step 9</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resource.

## 2.9.4 Example Code

```
// Start playback
    private void StartPlayBack() {
         if (m_hLoginHandle.longValue() == 0) {
             System.err.printf("Please Login First");
                  return;
         }
         // Playback and download cannot be performed simultaneously with the same login handle.
         if (m_hDownLoadHandle.longValue() != 0) {
                  JOptionPane.showMessageDialog(playFrame, "Please stop downloading");
                  return;
         }
         updatePlayBackParams(); // Update parameters
         // set stream type of playback

        return;
    }

NetSdk.CLIENT_SlowPlayBack(m_hPlayHandle);
}
```

### 2.10 Record Download

### 2.10.1 Introduction

Video surveillance system widely applies to city, airport, metro, bank and factory. When any event occurs, you need to download the video records and report to the leaders, public security bureau, or mass media. Therefore, record download is an important function.

The record download function helps you obtain the records saved on the device through SDK and save into the local. It allows you to download from the selected channels and export to the local disk or external USB flash drive.

This function is available for some select models.

### 2.10.2 Interface Overview

Table 2-11 Interfaces of record download

| Interface               | Implication                                     |
|-------------------------|-------------------------------------------------|
| CLIENT_QueryRecordFile  | Query for all the record files within a period. |
| CLIENT_DownloadByTimeEx | Download the record by time.                    |
| CLIENT_StopDownload     | Stop the record download.                       |

### 2.10.3 Process

You can import the start time and end time of download. SDK can download the specified record file and save to the required place.

You can also provide a callback pointer to SDK which calls back the specified record file to you for treatment.

Figure 2-14 Process of record download

## **Process Description**

- Step 1 Call **CLIENT\_Init** to initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> Call **CLIENT\_SetDeviceMode** to set the stream type for query time, and the parameter emType should be DH\_RECORD\_STREAM\_TYPE.
- <u>Step 4</u> Call **CLIENT\_DownloadByTimeEx** to start downloading by time. Either sSavedFileName or fDownLoadDataCallBack is valid. You can decide whether to use cbDownLoadPos; if not, set it as NULL.
- <u>Step 5</u> Call **CLIENT\_StopDownload** to stop download. You can close the download process after it is completed or it is just partially completed.
- <u>Step 6</u> After using the function module, call **CLIENT\_Logout** to log out of the device.
- <u>Step 7</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resource.

## 2.10.4 Example Code

```

# 2.11 Real-time Monitoring Transcoding

### 2.11.1 Introduction

Real-time monitoring transcoding involves getting live videos from storage devices or front-end devices and transcoding the videos into the stream type that you need. The supported stream types include:

- GB program stream.
- Transport streams.
- MP4 format.
- H.264 and H.265.
- Program streams.
- RTP streams.

### 2.11.2 Interface Overview

Table 2-12 Interfaces of real-time monitoring transcoding

| Interface                 | Implication                            |
|---------------------------|----------------------------------------|
| CLIENT_RealPlayByDataType | Start real-time monitoring transcoding |
|                           | interface.                             |
| CLIENT_StopRealPlay       | Stop real-time monitoring transcoding  |
|                           | interface.                             |

#### **2.11.3 Process**

Begin Initialize SDK CLIENT Init Log in to the device CLIENT\_LoginWithHighLevelSecurity Start real-time monitoring transcoding, hWnd Set callback function can be null fRealDataCallBackEx CLIENT\_RealPlayByDataType Stop real-time monitoring CLIENT\_StopRealPlayEx Log out of the device CLIENT\_Logout Release SDK resource CLIENT Cleanup End

Figure 2-15 Process of real-time monitoring transcoding

### **Process Description**

- Step 1 Initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> Call **CLIENT\_RealPlayByDataType** to start real-time monitoring. The parameter hWnd can be set to null.
- Step 4 Set the real-time data callback function fRealDataCallBackEx to save the transcoded data.
- Step 5 After using the real-time monitoring transcoding, call **CLIENT\_StopRealPlayEx** to stop it.
- <u>Step 6</u> After using the service, call **CLIENT\_Logout** to log out of the device.
- <u>Step 7</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resources.

# 2.12 Record Playback Transcoding

### 2.12.1 Introduction

Record playback transcoding refers to remotely playing videos from a specific time period on the client, searching for the needed videos, and transcoding them into the stream type that you need. The supported stream types include:

- GB program stream.
- Transport streams.
- MP4 format.
- H.264 and H.265.
- Program streams.
- RTP streams.

### 2.12.2 Interface Overview

Table 2-13 Interfaces of record playback transcoding

| Interface                 | Implication                                  |
|---------------------------|----------------------------------------------|
| CLIENT_PlayBackByDataType | Start record playback transcoding interface. |
| CLIENT_StopPlayBack       | Stop record playback transcoding interface.  |

#### **2.12.3 Process**

Begin Initialize SDK CLIENT\_Init Log in to the device CLIENT\_LoginWithHighLevelSecurity Set callback function Start record playback transcoding, hWnd can fDataCallBack be null fDataCallBackEx CLIENT PlayBackByDataType fDownLoadPosCallBack Stop record playback interface CLIENT\_StopPlayBack Log out of the device CLIENT\_Logout Release SDK resource CLIENT\_Cleanup End

Figure 2-16 Process of record playback transcoding

#### **Process Description**

- Step 1 Initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- <u>Step 3</u> Call **CLIENT\_PlayBackByDataType** to start downloading videos. The parameter hWnd can be set to null.
- Step 4 Set the video playback data callback functions fDataCallBackEx and fDataCallBack, and the video playback process callback function fDownLoadPosCallBack to save the transcoded data
- <u>Step 5</u> After using the record playback transcoding, call **CLIENT\_StopPlayBack** to stop it.
- <u>Step 6</u> After using the service, call **CLIENT\_Logout** to log out of the device.
- <u>Step 7</u> After using all SDK functions, call **CLIENT\_Cleanup** to release SDK resources.

# 2.13 Record Download Transcoding

### 2.13.1 Introduction

The record download function helps you obtain the records saved on the storage device through SDK and save into the local. It allows you to download records of different stream types from the selected channels and export to the local disk or external USB flash drive. The supported stream types include:

- GB program stream.
- Transport streams.
- MP4 format.
- H.264 and H.265.
- Program streams.
- RTP streams.

### 2.13.2 Interface Overview

Table 2-14 Interfaces of record download transcoding

| Interface                 | Implication                                  |
|---------------------------|----------------------------------------------|
| CLIENT_DownloadByDataType | Start record download transcoding interface. |
| CLIENT_StopDownload       | Stop record download transcoding interface.  |

#### **2.13.3 Process**

Figure 2-17 Process of record download transcoding Begin Initialize SDK **CLIENT Init** Log in to the device CLIENT\_LoginWithHighLevelSecurity Set callback function Start record download transcoding fTimeDownloadPosCallBackCLIENT\_DownloadByDataType fDataCallBack Stop record download CLIENT\_StopDownload Log out of the device CLIENT\_Logout Release SDK resource CLIENT\_Cleanup End

### **Process Description**

- Step 1 Initialize SDK.
- <u>Step 2</u> Call **CLIENT\_LoginWithHighLevelSecurity** to log in to the device.
- Step 3 Call CLIENT\_DownloadByDataType to start record download transcoding. The parameter hWnd can be set as null.
- Step 4 Set the video download process callback function fTimeDownloadPosCallBack, and the video download data callback function fDataCallBackEx to save the transcoded data.
- <u>Step 5</u> After using the record download transcoding, call **CLIENT\_StopDownload** to stop it.
- <u>Step 6</u> After using the service, call **CLIENT\_Logout** to log out of the device.
- <u>Step 7</u> After using all SDK functions, call **CLIENTCleanup** to release SDK resources.

| Note         | m_hLoginHandle =                                                                 |                                  |  |
|              | netsdk.CLIENT_CLIENT_LoginWithHighLevelSecurity(pstInParam, pstOutParam);        |                                  |  |

#### 3.2.2 CLIENT\_Logout

Table 3-6 Log out

| Item           | Description                           |                                                                 |  |
|----------------|---------------------------------------|-----------------------------------------------------------------|--|
| Name           | User logout the device.               | User logout the device.                                         |  |
| Function       | public boolean CLIENT_Lo              | public boolean CLIENT_Logout(LLong  LoginID);                   |  |
| Parameter      | [in]lLoginlD                          | [in]lLoginID Return value of CLIENT_LoginWithHighLevelSecurity. |  |
| Success: TRUE. |                                       |                                                                 |  |
| Return value   | Failure: FALSE.                       |                                                                 |  |
| Note           | This method is encapsulat             | red in the NetSDKLib interface and is usually called by:        |  |
| Note           | netsdk.CLIENT_Logout(m_hLoginHandle); |                                                                 |  |

# 3.3 Real-time Monitoring

#### 3.3.1 CLIENT\_RealPlayEx

Table 3-7 Start monitoring

| Item         | Description                                                                  |                                                      |  |
|--------------|------------------------------------------------------------------------------|------------------------------------------------------|--|
| Name         | Open the real-time monit                                                     | Open the real-time monitoring.                       |  |
| Function     | public LLong CLIENT_Rea                                                      | lPlayEx(                                             |  |
| Function     | LLong lLoginID, int n                                                        | ChannelID, Pointer hWnd, int rType);                 |  |
|              | [in]lLoginID                                                                 | Return value of CLIENT_LoginWithHighLevelSecurity.   |  |
|              | [in]nChannelID                                                               | Video channel number is a round number starting from |  |
| Parameter    |                                                                              | 0.                                                   |  |
|              | [in]hWnd                                                                     | Window handle valid only under Windows system.       |  |
|              | [in]rType                                                                    | Live type.                                           |  |
| Return value | Success: not 0                                                               |                                                      |  |
| Return value | Failure: 0                                                                   |                                                      |  |
|              | Windows system:                                                              |                                                      |  |
| Note         | When hWnd is valid, the corresponding window displays picture.               |                                                      |  |
| Note         | When hWnd is NULL, get the video data through setting a callback and send to |                                                      |  |
|              | user for handle.                                                             |                                                      |  |

Table 3-8 Live type and meaning

| Live type             | Meaning                                         |  |
|-----------------------|-------------------------------------------------|--|
| DH_RType_Realplay     | Real-time live                                  |  |
| DH_RType_Multiplay    | Multi-picture live                              |  |
| DLI DTuna Baalalay 0  | Real-time monitoring—main stream, equivalent to |  |
| DH_RType_Realplay_0   | DH_RType_Realplay                               |  |
| DH_RType_Realplay_1   | Real-time monitoring—sub stream 1               |  |
| DH_RType_Realplay_2   | Real-time monitoring—sub stream 2               |  |
| DH_RType_Realplay_3   | Real-time monitoring—sub stream 3               |  |
| DH_RType_Multiplay_1  | Multi-picture live—1 picture                    |  |
| DH_RType_Multiplay_4  | Multi-picture live—4 pictures                   |  |
| DH_RType_Multiplay_8  | Multi-picture live—8 pictures                   |  |
| DH_RType_Multiplay_9  | Multi-picture live—9 pictures                   |  |
| DH_RType_Multiplay_16 | Multi-picture live—16 pictures                  |  |
| DH_RType_Multiplay_6  | Multi-picture live—6 pictures                   |  |
| DH_RType_Multiplay_12 | Multi-picture live—12 pictures                  |  |
| DH_RType_Multiplay_25 | Multi-picture live—25 pictures                  |  |
| DH_RType_Multiplay_36 | Multi-picture live—36 pictures                  |  |

### 3.3.2 CLIENT\_StopRealPlayEx

Table 3-9 Stop monitoring

| Item | Description                    |
|------|--------------------------------|
| Name | Stop the real-time monitoring. |

| Item         | Description                                               |  |
|--------------|-----------------------------------------------------------|--|
| Function     | public boolean CLIENT_StopRealPlayEx(LLong   RealHandle); |  |
| Parameter    | [in]lRealHandle Return value of CLIENT_RealPlayEx.        |  |
| Dotum value  | Success: TRUE.                                            |  |
| Return value | • Failure: FALSE.                                         |  |
| Note         | None.                                                     |  |

#### 3.3.3 CLIENT\_SaveRealData

Table 3-10 Save monitoring data

| Item         | Description                             |                                             |  |
|--------------|-----------------------------------------|---------------------------------------------|--|
| Name         | Save the real-time monit                | Save the real-time monitoring data as file. |  |
| Function     | public boolean CLIENT_S                 | SaveRealData(                               |  |
| Function     | LLong IRealHandle, String pchFileName); |                                             |  |
|              | [in] IRealHandle                        | Return value of CLIENT_RealPlayEx.          |  |
| Parameter    | [in] pchFileName                        | Save path.                                  |  |
| Detumendue   | Success: TRUE.                          |                                             |  |
| Return value | Failure: FALSE.                         |                                             |  |
| Note         | None.                                   |                                             |  |

#### 3.3.4 CLIENT\_StopSaveRealData

Table 3-11 Stop saving monitoring data

| Item         | Description                                                |                                    |
|--------------|------------------------------------------------------------|------------------------------------|
| Name         | Stop saving the real-time monitoring data as file.         |                                    |
| Function     | public boolean CLIENT_StopSaveRealData(LLong lRealHandle); |                                    |
| Parameter    | [in] IRealHandle                                           | Return value of CLIENT_RealPlayEx. |
| Return value | Success: TRUE.                                             |                                    |
| Return value | Failure: FALSE.                                            |                                    |
| Note         | None.                                                      |                                    |

#### 3.3.5 CLIENT\_SetRealDataCallBackEx

Table 3-12 Set the callback of real-time monitoring data

| Item                                         | Description                                    |                                                 |
|----------------------------------------------|------------------------------------------------|-------------------------------------------------|
| Name                                         | Set the callback of real-time monitoring data. |                                                 |
| public boolean CLIENT_SetRealDataCallBackEx( |                                                | SetRealDataCallBackEx(                          |
| Function                                     | LLong lRealHandle,                             | StdCallCallback cbRealData,                     |
|                                              | Pointer dwUser, int dwFlag);                   |                                                 |
|                                              | [in] IRealHandle                               | Return value of CLIENT_RealPlayEx.              |
| Parameter                                    | [in] cbRealData                                | Callback of monitoring data flow.               |
| Parameter                                    | [in] dwUser                                    | Parameter of callback for monitoring data flow. |
|                                              | [in] dwFlag                                    | Type of monitoring data in callback.            |
| Return value                                 | Success: TRUE.                                 |                                                 |
|                                              | Failure: FALSE.                                |                                                 |

| Item | Description |
|------|-------------|
| Note | None.       |

Table 3-13 Type and meaning of dwFlag

| dwFlag     | Meaning                       |
|------------|-------------------------------|
| 0x00000001 | Initial data of device.       |
| 0x00000004 | Data converted to YUV format. |

### 3.4 Video Snapshot

#### 3.4.1 CLIENT\_SnapPictureToFile

Table 3-14 Synchronous snapshot

| Item         | Description                                        |                                                         |  |
|--------------|----------------------------------------------------|---------------------------------------------------------|--|
| Name         | Synchronous snapshot.                              |                                                         |  |
|              | public boolean CLIENT_                             | public boolean CLIENT_SnapPictureToFile(                |  |
| Function     | LLong lLoginID,                                    |                                                         |  |
|              | Pointer pInParam, I                                | Pointer pOutParam, int nWaitTime)                       |  |
|              | [in] lLoginID                                      | Return value of CLIENT_LoginWithHighLevelSecurity.      |  |
|              | [in] plnParam                                      | Input parameter. Refer to                               |  |
| Daramatar    |                                                    | NET_IN_SNAP_PIC_TO_FILE_PARAM.                          |  |
| Parameter    | [in] pOutParam                                     | Output parameter. Refer to                              |  |
|              |                                                    | NET_OUT_SNAP_PIC_TO_FILE_PARAM.                         |  |
|              | [in] nWaitTime                                     | Timeout. The unit is millisecond.                       |  |
| Return value | Success: TRUE.                                     |                                                         |  |
| Return value | Failure: FALSE.                                    |                                                         |  |
|              | Synchronous interfa                                | ace. The device captures snapshot and sends to the user |  |
| Note         | through internet.                                  |                                                         |  |
|              | This function is available for some select models. |                                                         |  |

### **3.4.2 CLIENT\_CapturePictureEx**

| Return value  | Success: Network playback ID.         |                                         |  |
| neturii value | • Failure: 0.                         |                                         |  |
| Note          | None.                                 |                                         |  |

### 3.9.2 CLIENT\_SetDeviceMode

Table 3-31 Set the work mode

| Item         | Description                                  |                                                    |  |
|--------------|----------------------------------------------|----------------------------------------------------|--|
| Name         | Set the work mode.                           |                                                    |  |
| Function     | public boolean CLIENT_Se                     | public boolean CLIENT_SetDeviceMode(               |  |
| Function     | LLong ILoginID, int emType, Pointer pValue); |                                                    |  |
|              | [in] ILoginID                                | Return value of CLIENT_LoginWithHighLevelSecurity. |  |
| Parameter    | [in] emType                                  | Work mode enumeration.                             |  |
|              | [in] pValue                                  | The corresponding structure of work mode.          |  |
| Detumenalue  | Success: TRUE.                               |                                                    |  |
| Return value | • Failure: FALSE.                            |                                                    |  |
| Note         | None.                                        |                                                    |  |

The following table shows information about work mode enumeration and structure.

Table 3-32 Work mode enumeration and structure

| emType enumeration     | Meaning                             | Structure |
|------------------------|-------------------------------------|-----------|
| DH RECORD STREAM TYPE  | Set the stream type of recorded     | None      |
| DII_RECORD_STREAM_TTTE | videos to be queried or played back | None      |

| emType enumeration | Meaning                               | Structure        |
|--------------------|---------------------------------------|------------------|
|                    | by time.                              |                  |
|                    | 0: Main and sub stream                |                  |
|                    | • 1: Main stream                      |                  |
|                    | • 2: Sub stream                       |                  |
| DIL DECORD TYPE    | Set the record file type to play back | NET RECORD TYPE  |
| DH_RECORD_TYPE     | and download by time.                 | INET_RECORD_TYPE |

### 3.9.3 CLIENT\_StopPlayBack

Table 3-33 Stop record playback

| Item         | Description              |                                                        |  |
|--------------|--------------------------|--------------------------------------------------------|--|
| Name         | Stop video playback.     |                                                        |  |
| Function     | public boolean CLIENT_St | public boolean CLIENT_StopPlayBack(LLong IPlayHandle); |  |
| Parameter    | [in] 1PlayHandle         | Return value of playback interface.                    |  |
| Return value | Success: TRUE.           |                                                        |  |
| Return value | Failure: FALSE.          |                                                        |  |
| Note         | None.                    |                                                        |  |

#### 3.9.4 CLIENT\_PausePlayBack

Table 3-34 Pause or resume record playback

| Item         | Description               |                                                    |
|--------------|---------------------------|----------------------------------------------------|
| Name         | Pause or resume playback. |                                                    |
| Function     | public boolean CLIENT_F   | PausePlayBack(LLong IPlayHandle, int bPause);      |
|              | [in] lPlayHandle          | Return value of playback interface.                |
| Parameter    |                           | Parameters for network playback stops and resumes: |
| Parameter    | [out] bPause              | 1: Pause                                           |
|              |                           | 0: Resume                                          |
| Return value | Success: TRUE.            |                                                    |
| neturn value | Failure: FALSE.           |                                                    |
| Note         | Pause or resume the ong   | oing playback.                                     |

| Parameter    | [in] IFileHandle                                                                      | Return value of CLIENT_DownloadByTimeEx. |
| Datumaralua  | Success: ID of download.                                                              |                                          |
| Return value | • Failure: 0.                                                                         |                                          |
| Note         | Stop downloading after it is completed or partially completed according to particular |                                          |
|              | situation.                                                                            |                                          |

### **4 Callback Definition**

#### 4.1 fDisConnect

Table 4-1 Disconnection callback

| Item         | Description                    |                                                    |
|--------------|--------------------------------|----------------------------------------------------|
| Name         | Disconnection callback.        |                                                    |
|              | public interface fDisConne     | ect extends StdCallCallback {                      |
|              | public void invo               | ke(                                                |
| Function     | LLong lLog                     | inID,                                              |
| Function     | String pchDVRIP, int nDVRPort, |                                                    |
|              | Pointer dwUser);               |                                                    |
|              | }                              |                                                    |
|              | [out]  Login D                 | Return value of CLIENT_LoginWithHighLevelSecurity. |
| Parameter    | [out] pchDVRIP                 | IP of the disconnected device.                     |
| Parameter    | [out] nDVRPort                 | Port of the disconnected device.                   |
|              | [out] dwUser                   | User parameter of the callback.                    |
| Return value | None.                          |                                                    |
| Note         | None.                          |                                                    |

#### 4.2 fHaveReConnect

Table 4-2 Reconnection callback

| Item         | Description                    |                                                    |
|--------------|--------------------------------|----------------------------------------------------|
| Name         | Reconnection callback.         |                                                    |
|              | public interface fHaveReC      | onnect extends StdCallCallback {                   |
|              | public void invo               | ke(                                                |
| Function     | LLong lLog                     | inID,                                              |
| Function     | String pchDVRIP, int nDVRPort, |                                                    |
|              | Pointer dwUser);               |                                                    |
|              | }                              |                                                    |
|              | [out]  Login D                 | Return value of CLIENT_LoginWithHighLevelSecurity. |
| Parameter    | [out] pchDVRIP                 | IP of the reconnected device.                      |
| Parameter    | [out] nDVRPort                 | Port of the reconnected device.                    |
|              | [out] dwUser                   | User parameter of the callback.                    |
| Return value | None.                          |                                                    |
| Note         | None.                          |                                                    |

### 4.3 fRealDataCallBackEx

Table 4-3 Callback of real-time monitoring data

| Item         | Description                                                    |                                                          |
|--------------|----------------------------------------------------------------|----------------------------------------------------------|
| Name         | Callback of real-time monitoring data.                         |                                                          |
|              | public interface fRealDataCallBackEx extends StdCallCallback { |                                                          |

|            | }                                |                                                        |  |
|            | [out]IPlayHandle                 | Return value of CLIENT_DownloadByTimeEx.               |  |
|            | [out] dwTotalSize                | Total size of playback. The unit is KB.                |  |
|            |                                  | The size that has been played. The unit is KB.         |  |
| Downerston | [out]dwDownLoadSize              | • -1: Current download finished.                       |  |
| Parameter  |                                  | • -2: Write file failed.                               |  |
|            | [out] index                      | Index.                                                 |  |
|            | [out] recordfileinfo             | Record file information.                               |  |
|            | [out] dwUser                     | User data.                                             |  |

| Item         | Description |
|--------------|-------------|
| Return value | None.       |

### 4.7 fMessCallBack

Table 4-7 Alarm subscription callback

| Item         | Description             | Description                                        |  |
|--------------|-------------------------|----------------------------------------------------|--|
| Name         | Callback of real-time r | Callback of real-time monitoring data.             |  |
|              | public interface fMess  | CallBack extends StdCallCallback{                  |  |
|              | public boole            | ean invoke(                                        |  |
|              | int ICor                | nmand , LLong lLoginID ,                           |  |
| Function     | Pointer                 | pStuEvent , int dwBufLen ,                         |  |
|              | String s                | String strDeviceIP , NativeLong nDevicePort ,      |  |
|              | Pointer dwUser);        |                                                    |  |
|              | }                       |                                                    |  |
|              | [out] ICommand          | Concrete alarm event.                              |  |
|              | [out]  Login D          | Return value of CLIENT_LoginWithHighLevelSecurity. |  |
|              | [out] pStuEvent         | Returned data pointer.                             |  |
| Parameter    | [out] dwBufLen          | Length of the returned pointer.                    |  |
|              | [out] strDeviceIP       | Returned IP.                                       |  |
|              | [out] nDevicePort       | Returned port number.                              |  |
|              | [out] dwUser            | User parameter of the callback.                    |  |
| Return value | None.                   | None.                                              |  |
| Note         | None.                   |                                                    |  |

### 4.8 Asynchronous Snapshot

Table 4-8 Callback of asynchronous snapshot.

| Item         | Description                                 |                                                  |
|--------------|---------------------------------------------|--------------------------------------------------|
| Name         | Callback of asynchronous snapshot.          |                                                  |
|              | public interface fSnapRev extends Callback{ |                                                  |
|              | public void invoke(                         |                                                  |
|              | LLong lLoginID,                             |                                                  |
| Function     | Pointer pBuf, int RevLen, int EncodeType,   |                                                  |
|              | int CmdSerial, Pointer dwUser);             |                                                  |
|              | }                                           |                                                  |
| Parameter    | [out] ILoginID                              | Return value of CLIENT_LoginWithHighLevelSerity. |
|              | [out] pBuf                                  | Address of asynchronous snapshot.                |
|              | [out] RevLen                                | Length of asynchronous snapshot.                 |
|              | [out] EncodeType                            | Encoding type.                                   |
|              | [out] CmdSerial                             | Operation serial number.                         |
|              | [out] dwUser                                | User parameter of the callback.                  |
| Return value | None.                                       |                                                  |
| Note         | None.                                       |                                                  |

# 4.9 Real-time Monitoring Transcoding Data Callback Function

Table 4-9 Callback of real-time monitoring transcoding data.

| Item      | Description                                                                        |                                            |
|-----------|------------------------------------------------------------------------------------|--------------------------------------------|
| Name      | Extension 2 of the prototype for the live view transcoding data callback function. |                                            |
|           | public interface fRealDataCallBackEx extends SDKCallback{                          |                                            |
|           | public void invoke(LLong lRealHandle,                                              |                                            |
| l         | int dwDataType,                                                                    |                                            |
| Function  | Pointer pBuffer,                                                                   |                                            |
| Function  | int dwBufSize,                                                                     |                                            |
|           | int param,                                                                         |                                            |
|           | Pointer dwUser);                                                                   |                                            |
|           | }                                                                                  |                                            |
|           | [out]lRealHandle,                                                                  | Return value of CLIENT_RealPlayByDataType. |
|           | [out]dwDataType                                                                    | 0: Raw data.                               |
| Parameter |                                                                                    | 1: Frame data.                             |
|           |                                                                                    | 2: YUV data.                               |
|           |                                                                                    | 3: PCM audio data.                         |
|           | [out]pBuffer                                                                       | Byte data.                                 |
|           | [out]dwBufSize                                                                     | Byte length.                               |

|              | [out]param  | When the type is 0 (raw data) and 2 (YUV data), it is set to 0. When the callback data type is 1, the param is a structure pointer of tagVideoFrameParam. When the data type is 3, the parameter is also a structure pointer of tagCBPCMDataParam. |
|--------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | [out]dwUser | User parameter of the callback.                                                                                                                                                                                                                    |
| Return value | None.       |                                                                                                                                                                                                                                                    |
| Note         | None.       |                                                                                                                                                                                                                                                    |

# 4.10 Playback Process Callback Function

Table 4-10 Callback of playback process.

| Item         | Description                                                                       |                                            |  |

|              | public void invoke(                                                               |                                            |  |
|              | LLong IPlayHandle,                                                                |                                            |  |
| Function     | int dwTotalSize,                                                                  |                                            |  |
|              | int dwDownLoadSize,                                                               |                                            |  |
|              | Pointer dwUser);                                                                  |                                            |  |
|              | }                                                                                 |                                            |  |
|              | [out]IPlayHandle                                                                  | Return value of CLIENT_PlayBackByDataType. |  |
|              | [out]dwTotalSize                                                                  | Total size (KB).                           |  |
| Darameter    | [out]dwDownLoadSize                                                               | Played video size (KB).                    |  |
| Parameter    |                                                                                   | -1: Playback ends.                         |  |
|              |                                                                                   | -2: Failed to write the file.              |  |
|              | [out]dwUser                                                                       | User parameter of the callback.            |  |
| Return value | None.                                                                             |                                            |  |
| Note         | During video playback, a callback function is used for playback process.          |                                            |  |
|              | We recommend you not call NetSDK interface under this callback function.          |                                            |  |
|              | However, if the callback function within the demo calls NetSDK interface, you can |                                            |  |
|              | handle it similarly.                                                              |                                            |  |

# 4.11 Playback Data Callback Function

Table 4-11 Callback of playback data.

| Item | Description                      |  |
|------|----------------------------------|--|
| Name | Playback data callback function. |  |

| Function     | public interface fDataCallBack extends SDKCallback {                              |                                                     |  |
|--------------|-----------------------------------------------------------------------------------|-----------------------------------------------------|--|
|              | public void invoke(                                                               |                                                     |  |
|              | LLong IPlay Handle,                                                               |                                                     |  |
|              | int dwDataType,                                                                   |                                                     |  |
|              | Pointer pBuffer,                                                                  |                                                     |  |
|              | int dwBufSize,                                                                    |                                                     |  |
|              | Pointer dwl                                                                       | Pointer dwUser);                                    |  |
|              | }                                                                                 |                                                     |  |
|              | [out]lPlayHandle                                                                  | Return value of CLIENT_PlayBackByDataType.          |  |
|              |                                                                                   | Use with EM_REAL_DATA_TYPE. The value of the        |  |
|              | [at]dDataTa                                                                       | parameter dwDataType in the data callback functions |  |
| Danamatan    | [out]dwDataType                                                                   | fRealDataCallBackEx and fDataCallBack for the       |  |
| Parameter    |                                                                                   | transcoded streams.                                 |  |
|              | [out]pBuffer                                                                      | Byte data.                                          |  |
|              | [out]dwBufSize                                                                    | Byte length.                                        |  |
|              | [out]dwUser                                                                       | User parameter of the callback.                     |  |
| Return value | None.                                                                             |                                                     |  |
| Note         | During video playback, a callback function is used for playback process.          |                                                     |  |
|              | We recommend you not call NetSDK interface under this callback function.          |                                                     |  |
|              | However, if the callback function within the demo calls NetSDK interface, you can |                                                     |  |
|              | handle it similarly.                                                              |                                                     |  |

### **Appendix 1 Cybersecurity Recommendations**

Cybersecurity is more than just a buzzword: it's something that pertains to every device that is connected to the internet. IP video surveillance is not immune to cyber risks, but taking basic steps toward protecting and strengthening networks and networked appliances will make them less susceptible to attacks. Below are some tips and recommendations on how to create a more secured security system.

#### Mandatory actions to be taken for basic device network security:

#### 1. Use Strong Passwords

Please refer to the following suggestions to set passwords:

- The length should not be less than 8 characters;
- Include at least two types of characters; character types include upper and lower case letters, numbers and symbols;
- Do not contain the account name or the account name in reverse order;
- Do not use continuous characters, such as 123, abc, etc.;
- Do not use overlapped characters, such as 111, aaa, etc.;

#### 2. Update Firmware and Client Software in Time

- According to the standard procedure in Tech-industry, we recommend to keep your device (such as NVR, DVR, IP camera, etc.) firmware up-to-date to ensure the system is equipped with the latest security patches and fixes. When the device is connected to the public network, it is recommended to enable the "auto-check for updates" function to obtain timely information of firmware updates released by the manufacturer.
- We suggest that you download and use the latest version of client software.

#### "Nice to have" recommendations to improve your device network security:

#### 1. Physical Protection

We suggest that you perform physical protection to device, especially storage devices. For example, place the device in a special computer room and cabinet, and implement well-done access control permission and key management to prevent unauthorized personnel from carrying out physical contacts such as damaging hardware, unauthorized connection of removable device (such as USB flash disk, serial port), etc.

#### 2. Change Passwords Regularly

We suggest that you change passwords regularly to reduce the risk of being guessed or cracked.

#### 3. Set and Update Passwords Reset Information Timely

The device supports password reset function. Please set up related information for password reset in time, including the end user's mailbox and password protection questions. If the information changes, please modify it in time. When setting password protection questions, it is suggested not to use those that can be easily guessed.

#### 4. Enable Account Lock

The account lock feature is enabled by default, and we recommend you to keep it on to guarantee the account security. If an attacker attempts to log in with the wrong password several times, the corresponding account and the source IP address will be locked.

#### 5. Change Default HTTP and Other Service Ports

We suggest you to change default HTTP and other service ports into any set of numbers between 1024~65535, reducing the risk of outsiders being able to guess which ports you are using.

#### 6. Enable HTTPS

We suggest you to enable HTTPS, so that you visit Web service through a secure communication

#### 7. MAC Address Binding

We recommend you to bind the IP and MAC address of the gateway to the device, thus reducing the risk of ARP spoofing.

#### 8. Assign Accounts and Privileges Reasonably

According to business and management requirements, reasonably add users and assign a minimum set of permissions to them.

#### 9. Disable Unnecessary Services and Choose Secure Modes

If not needed, it is recommended to turn off some services such as SNMP, SMTP, UPnP, etc., to reduce risks.

If necessary, it is highly recommended that you use safe modes, including but not limited to the following services:

- SNMP: Choose SNMP v3, and set up strong encryption passwords and authentication passwords.
- SMTP: Choose TLS to access mailbox server.
- FTP: Choose SFTP, and set up strong passwords.
- AP hotspot: Choose WPA2-PSK encryption mode, and set up strong passwords.

#### 10. Audio and Video Encrypted Transmission

If your audio and video data contents are very important or sensitive, we recommend that you use encrypted transmission function, to reduce the risk of audio and video data being stolen during transmission.

Reminder: encrypted transmission will cause some loss in transmission efficiency.

#### 11. Secure Auditing

- Check online users: we suggest that you check online users regularly to see if the device is logged in without authorization.
- Check device log: By viewing the logs, you can know the IP addresses that were used to log
  in to your devices and their key operations.

#### 12. Network Log

Due to the limited storage capacity of the device, the stored log is limited. If you need to save the log for a long time, it is recommended that you enable the network log function to ensure that the critical logs are synchronized to the network log server for tracing.

#### 13. Construct a Safe Network Environment

In order to better ensure the safety of device and reduce potential cyber risks, we recommend:

- Disable the port mapping function of the router to avoid direct access to the intranet devices from external network.
- The network should be partitioned and isolated according to the actual network needs. If
  there are no communication requirements between two sub networks, it is suggested to
  use VLAN, network GAP and other technologies to partition the network, so as to achieve
  the network isolation effect.
- Establish the 802.1x access authentication system to reduce the risk of unauthorized access to private networks.
- Enable IP/MAC address filtering function to limit the range of hosts allowed to access the device.
